Why Astra felt worse, and the one fix on your side

Old skills firing, a context test pulled, bad
engines out.

Stale skills were firing too often

Skills written for earlier models triggered constantly and got in the way of the model checking its own work.

A context experiment was pulled

An opt-in context test caused early stops and replies to older messages. Roughly 4-5k users hit it.

Badly configured engines removed

Part of the traffic was running through engines that measurably degraded quality. Those are out.

What you should feel now

Steadier follow-through, closer tracking of your latest message, and more checking of the work as it runs.

Your move tonight

Delete saved skills written for a model you no longer use, then re-run last week's worst output.
